Teltor	nika Dashcam testing instructions	1
1.	Wiring connection	3
2.	Configuration	4
3.	Server connection	7
4.	SMS/GPRS commands	8

1. Wiring connection

Connection of Teltonika DashCam to the FMX125 should be done with 4 wires that are attached to the DashCam. These wires include Power & Ground wires which are connected directly to the power supply and Tx and Rx wires which should be connected to FMX125 PIN 3-Rx and 4-Tx. Important to note DashCam's RX wire should be connected with Tx cable of the FMX125 device and Tx cable should be connected to the Rx input. When testing the devices on the table, please connect power and ground cables directly to power supply. The difference of connection between tests on table and connection to vehicle is explain further below.

Figure 1 Performing tests on table with power supply

When connecting DashCam to the vehicle, the user has to ensure that DashCam is not directly connected to the battery of the vehicle as it will get direct power input which will result in the camera staying on all the time and will not shut down until the battery is empty. In some cases, vehicle batteries could be empty within1 day of connection and therefore, it is important to understand that the DashCam should be connected to the ignition wire or relay which will either provide power or cut it off the DashCam upon vehicle ignition state.

Figure 2 Performing connection directly on the vehicle

Once the FMX125 device and DashCam is connected on the table, turn on the power supply and the DashCam should make a tick noise for 1 time, this will indicate that the camera went online and is receiving power from the supply. Once this is done, connect the micro-USB cable to the FMX125 and the other end to the PC and open the designated configurator for DashCam configuration.

Once the setup is finished, navigating to IO settings (picture below), you will be able to see the state of the camera here:

Bluetooth	Battery Level %	Setting the camera state priority to low will report
	BT Status	camera state directly to server and also TF card
Bluetooth 4.0		status. These are the values these parameters are
Beacon List	UL202 Fuel Level	able to show:
Authorization ID List	UL202 Status	
1/0	Pulse Counter DIN1	O - Camera not detected
		↓ • 1 - No card
OBD II	Coordinates ISO6709	2 - Card mount failed
CAN Adapter	Ignition On Counter	• 3 - Card mounted
RS232 \ RS485	Front Camera State	+ • 4 - Card faulty

2. Configuration

It is important to turn on codec 8E at the start of the configuration as it is required for the extra information of AVL ID's that are being transferred by the device. This setting can be found under System tab in the Teltonika Configurator.

Data Protocol	
Codec 8	Codec 8 Extended

Please ensure the FMX125 device has the latest FW to support DashCam which is currently 03.27.13.Rev.661 and configurator version: Teltonika.Configurator_1.7.54_E.DualCamSupport_R.18 which will allow access to the DashCam settings in the RS232 tab. If you have a different FW version for your device, please contact your sales representative in order to receive the newest firmware and configurator for your device.

System GPRS	External UART Mode Disable	
GPRS	Disable	
Natural Cattlena		RS232
Network Settings	RS485

Accelerometer Features	LLS	LCD
Auto Geofence	RFID HID	RFID MF7
Manual Geofence	Garmin FMI	TCP/UDP Ascii
Trip \ Odometer	TCP/UDP Binary	TCP/UDP Ascii Buffered
Bluetooth	TCP/UDP Binary Buffered	Mercury C4
Bluetooth 4.0	UL202 Fuel Sensor	DualCam
Beacon List	DashCam	
Authorization ID List		
I/O		
OBD II		
CAN Adapter		
RS232 \ RS485		

RS232 Settings			
Baudrate			
Default	1200		
2400	4800		
9600	14400		
19200	38400		
57600	115200		
Parity			
Default	None		
Odd	Even		

If you are unable to see this selection in your configurator, please check the configurator version and the FW of the device.

Once the DashCam is selected, possible options will appear for selection which will allow to set the configuration of the device. Different resolution and compression can be selected for the picture quality, in some cases, when the picture quality is low, it is beneficial to play around with image resolution and compression in order to see which settings would suit the user themost. Another important factor is OSD Display which shows date and time when the video/photo was taken. In some cases, if usersfrom different regions are facing time issues and the hours differ from the actual hours the video or photo was taken, they would

Camera Feature Settin	ngs	5	
Camera Picture Resolu	utio	on	
160 x 120		320 x 240	
640 x 480		1280 x 720	
1920 x 1080			
Camera Picture Comp	res	ssion 50 🗘	
OSD Display			
Disable		Enable	
Video Frame Rate	2	5 FPS 🗸	
File transfer priotity		lternating 🗸	
Camera Time Zone	U	VTC+00:00	

need to check the Camera Time Zone parameter and set it to their applicable time zone.

In regards to picture resolution, Teltonika Telematics cannot advice on the most suitable resolution as it is heavily dependent on the user's use case scenario and their requirements and therefore, please proceed to this wiki page (<u>here</u>) where image resolution, sizes and transfer speeds are described.

Periodic image sending and image triggering are also selectable parameters which can be set to automatically send images into the designated server or a trigger can be used to send photos taken at the time the trigger was initiated.

Testing triggers can be done by selecting any of the applicable triggers, either DIN's or features and manually activating them by either adding DIN to a power output on the power supply or activating some of the features like Crash. Where the user lightly hits the device on to a table or a hand in order to activate gyroscope which in turn activates Crash feature and the image

will be taken. Some of the other features can be tested inside of the vehicle, like Green Driving. Please make sure that the these features are actually turned on in "Features" tab and configured.

Video Settings

Video Seno	ling Trigger			
	DIN1		DIN2	
C	irash			
Video dura	tion before trig	ger (s)		5 🗘
Video dura	tion after trigge	er (s)		5 🗘
Video So	ource by Trigge	er		
Trigger	Camera Sour	ce		
Trigger DIN1	Camera Sour Front	ce	~	
Trigger DIN1 DIN2	Camera Sour Front Front	r	~	

Video settings do not have periodic sending, however Video sending triggerscan be used in order to initiate video record and send the footage to the designated server. Same as Photo settings, DIN1 and DIN2 can be used to initiate the trigger and start the camera recording. Feature like Crash can again be initiated by gently hitting the device with a hand or on a table. It isalso possible to test different cameras with different triggers, just select applicable source for the desired trigger.

3. Server connection

Once the FMX125 device is setup with the required settings, a server has to be entered which will allow the user to send the videos/photos to their desired server. This can be tested by entering server IP address and port number into the requested fields and activating a trigger or setting up periodic image sending.

Camera scenario mode has 2 selectable parameters which are "On Ignition and Always". **On Ignition** parameter sets the camera to send data only when there is ignition in the **vehicle** or whether it is set up in the Systems tab as power source and **power supply** connected when testing on the table. This can be tested by setting device ignition'low voltage' a bit lower than the actual voltage currently being supplied to the device. This means that when there is enough power, ignition will turn on and the camera will keep on recording sending

data records to the server and once ignition turns off, camera will start saving records in itself. **Always** parameter means that as long as there is power no matter whether the ignition status is ON or OFF to the FMX125 device, **IF** periodic image sending is set up **OR** SMS command is issued requesting video/photo the camera will keep on sending records to the server. <u>Please note, this is not the parameter to set the camera working status, it is meant for data sending only so if the camera is directly connected to the battery in the vehicle, it will drain its power constantly and will drain vehicle's battery.</u>

TELTONIKA TELEMATICS UAB Saltoniskiu st. 9B-1, LT-08105 Vilnius, Lithuania

4. SMS/GPRS commands

Specific commands can be issued to camera in order to test whether it is correctly working:

camgetver – is a command that can be issued to the camera in order to find out the versions of both cameras. Also, because there are one camera, one version are returned. The complete response would look like this: Front camera V2.2.3. A failed response from the camera would be: The front camera camgetver failed. In this case, the camera will require flashing, it is broken or wiring is not connected appropriatly.

camreq: <file_type>,<file_source>,<timestamp>,<duration> ,<domain>,<port> - is a command that sends video/photo requests to the FMX125 device and the device will start taking either the video or photo and send it to the designated server. Testing here can be performed by requesting either video or photo and by selecting the most suitable source which is either front, back or both directions. A secondary server can alsobe tested by entering different Domain and Port number in the message. If requesting a photo, duration hasto be left is 0. The general structure of this command is as follows: <**file_type>**

- 0- Video
- 1- Photo

<file_source>

1 - Front camera

<timestamp>

Unix timestamps in decimal (not required for photo download)

<duration>

Video duration in seconds from provided timestamps (not required for photo download), (max 30 sec)

TELTONIKA TELEMATICS UAB Saltoniskiu st. 9B-1, LT-08105 Vilnius, Lithuania

Registration code 305578349 VAT number LT100013240611

Swedbank AB LT71 7300 0101 6274 0043 S.W.I.F.T. HABALT22

C Tel. +370 5 212 7472 Fax. +370 5 276 1380 www.teltonika-gps.com info@teltonika.lt

Structure examples:

camreq:<file type>,<file source>(if video, add ",<timestamp>,<duration>)

However, if there is a need to send to the specific server without configuring, you can add two extra parameters.

The complete structure:

camreq:<file type>,<file source>(if video, add ",<timestamp>,<duration>),<domain>,port

For example: camreq:0,1,1624960616,5,212.59.13.226,7160

5 - Credits

If you have any further questions/issues with connection of the DashCam and FMX125 device, please contact your direct sales representative OR create a VIP Helpdesk query where a technical support memberwill be assigned to you.

After completion of the testing, please provide feedback to your direct sales representative, we would appreciate your contribution to improving our services and quality of provided information.
