# WIRING SCHEME

### **SET UP YOUR DEVICE** HOW TO INSERT MICRO-SIM CARD AND CONNECT THE BATTERY

### UNSCREW SCREWS

**Unscrew** 4 screws counterclockwise that are located on the **bottom** of the device.

### 2 COVER REMOVAL

Remove the cover

### SIM CARD INSERT

Insert SIM card as shown with PIN request disabled or read Security info<sup>1</sup> how to enter it later in Teltonika Configurator<sup>2</sup>. Make sure that SIM card cut-off corner is pointing forward to slot. SIM slot 1 is closer to PCB, SIM slot 2 is the upper one.

<sup>1</sup> wiki.teltonika.lt/view/FMB641\_Security\_info <sup>2</sup> wiki.teltonika.lt/view/Teltonika\_Configurator

### 4 BATTERY CONNECTION

Connect **battery** as shown to device.

### ATTACHING COVER BACK

After configuration, see **"PC Connection (Windows)**", attach device cover back.

<sup>1</sup>Page 7 "PC Connection (Windows)

### DEVICE IS READY

Screw in all screws. Device is ready to be mounted.

SIM card insertion/ removal must be performed when device is powered off – external voltage and internal

battery disconnected. Otherwise SIM card might be damaged or device will not detect it.

FMX6 devices use Standard size SIM cards for SIM1 and SIM2. Currently most of the SIM cards provided

by operators can be disassembled into 3 parts - Standard/Micro/Nano. Depending on the SIM card construction - during device usage in harsh conditions, SIM assembly might come apart which causes instability when connecting to operator.

To avoid such risk:

- If possible ask operator for Standard SIM card with solid construction (not pre-cut to 3 parts)
- Do not use SIM cards that were previously disassembled (SIM was taken apart previously)
- If you plan to use only one SIM card

   insert it into SIM1 slot (lower slot)
   this ensures greater pressure on SIM contacts as the contact bed is pushed by PCB.

When 2 SIM cards are used simultaneously risk is mitigated as well - when SIM1 is inserted, a greater pressure is applied for SIM2, so SIM parts are harder to come lose.

# **PC CONNECTION (WINDOWS)**

- Power-up FMC640 with DC voltage (8 32 V) power supply using supplied power cable. LED's should start blinking, see "LED indications".
- 2. Connect device to computer using Micro-USB cable or Bluetooth connection:
  - Using Mini-USB cable
    - You will need to install USB drivers, see "How to install USB drivers (Windows)2"
- 3. You are now ready to use the device on your computer.

<sup>1</sup>wiki.teltonika-gps.com/view/FMC640\_LED\_status <sup>2</sup>Page 7, "How to install USB drivers"

# HOW TO INSTALL USB DRIVERS (WINDOWS)

- 1. Please download COM port drivers from here<sup>1</sup>.
- 2. Extract and run TeltonikaCOMDriver.exe.
- 3. Click Next in driver installation window.
- 4. In the following window click Install button.
- 5. Setup will continue installing the driver and eventually the confirmation window will appear. Click **Finish** to complete the setup.

# **CONFIGURATION (WINDOWS)**

At first FMC640 device will have default factory settings set. These settings should be changed according to the users needs. Main configuration can be performed via Teltonika Configurator<sup>1</sup> software. Get the latest Configurator version from here<sup>2</sup>. Configurator operates on Microsoft Windows OS and uses prerequisite MS .NET Framework. Make sure you have the correct version installed.

After connection to Configurator Status window will be displayed.

Various Status window<sup>1</sup> tabs display information about GNSS<sup>2</sup>, GSM<sup>3</sup>, I/O<sup>4</sup>, Maintenance<sup>5</sup> and etc. FMC640 has one user editable profile, which can be loaded and saved to the device. After any modification of configuration the changes need to be saved to device using Save to device button. Main buttons offer following functionality:

- Load from device loads configuration from device.
- Save to device saves configuration to device.
- Load from file loads configuration from file.
- Save to file saves configuration to file.
- Update firmware updates firmware on device.
- Read records reads records from the device.
- - Reboot device restarts device.
- Reset configuration sets device configuration to default.

Most important configurator section is GPRS - where all vour server and GPRS settings<sup>6</sup> can be configured and Data Acquisition<sup>7</sup> – where data acquiring parameters can be configured. More details about FMC640 configuration using Configurator can be found in our Wiki<sup>8</sup>.

# **QUICK SMS CONFIGURATION**

Default configuration has optimal parameters present to ensure best performance of track quality and data usage.

Quickly set up your device by sending this SMS command to it:

### **DEFAULT CONFIGURATION SETTINGS**

### MOVEMENT AND IGNITION DETECTION:

VEHICLE MOVEMENT will be detected by accelerometer IGNITION will be detected by vehicle power voltage between 13,2 – 30 V

RECORDS SENDING TO

### DEVICE MAKES A RECORD ON MOVING IF ONE OF THESE EVENTS HAPPEN:

PASSES 300 seconds

VEHICLE TURNS 10 degrees

VEHICLE DRIVES 100 meters

SPEED DIFFERENCE between last coordinate and current position is greater than 10 km/h

### DEVICE MAKES A Record on stop IF:

1 HOUR PASSES while vehicle is stationary and ignition is off

SERVER:

EVERY 120 SECOND it is sent to the server If device has made a record

After successful SMS configuration, FMC640 device will synchronize time and update records to configured server. Time intervals and default I/O elements can be changed by using Teltonika Configurator<sup>1</sup> or SMS parameters<sup>2</sup>.

# **MOUNTING RECOMMENDATIONS**

#### CONNECTING WIRES

- Wires should be fastened to the other wires or non-moving parts. Try to avoid heat emitting and moving objects near the wires.
- The connections should not be seen very clearly. If factory isolation was removed while connecting wires, it should be applied again.
- If the wires are placed in the exterior or in places where they can be damaged or exposed to heat, humidity, dirt, etc., additional isolation should be applied.
- · Wires cannot be connected to the board computers or control units.

#### CONNECTING POWER SOURCE

- Be sure that after the car computer falls asleep, power is still available on chosen wire. Depending on car, this may happen in 5 to 30 minutes period.
- When module is connected, measure voltage again to make sure it did not decrease.
- It is recommended to connect to the main power cable in the fuse box.
- Use 3A, 125V external fuse.

#### CONNECTING IGNITION WIRE

- Be sure to check if it is a real ignition wire i. e. power does not disappear after starting the engine.
- Check if this is not an ACC wire (when key is in the first position, most of the vehicle electronics are available).
- · Check if power is still available when you turn off any of vehicles devices.
- Ignition is connected to the ignition relay output. As alternative, any other relay, which has power output when ignition is on, may be chosen.

#### CONNECTING GROUND WIRE

- Ground wire is connected to the vehicle frame or metal parts that are fixed to the frame.
- If the wire is fixed with the bolt, the loop must be connected to the end of the wire.
- For better contact scrub paint from the spot where loop is going to be connected.

# **LED INDICATIONS**

### **NAVIGATION LED INDICATIONS**

| BEHAVIOUR                   | MEANING  |
|-----------------------------|--|
| Permanently<br>switched on  | GNSS signal is not received  |
| Blinking every second       | Normal mode, GNSS is working   |
| Off                         | GNSS is turned off because:<br>Device is not working or Device is in<br>sleep mode |
| Blinking fast<br>constantly | Device firmware is being flashed   |

### **STATUS LED INDICATIONS**

| BEHAVIOUR                      | MEANING   |  |
|--------------------------------|---|--|
| Blinking every second          | Normal mode                                     |  |
| Blinking every two<br>seconds  | Sleep mode                                      |  |
| Blinking fast for a short time | Modem activity                                  |  |
| Off                            | Device is not working or Device is in boot mode |  |

# **SAFETY INFORMATION**

This message contains information on how to operate FMC640 safely. By following these requirements and recommendations, you will avoid dangerous situations. You must read these instructions carefully and follow them strictly before operating the device!

- The device uses SELV limited power source. The nominal voltage is +12 V DC. The allowed voltage range is +10...+30 V DC.
- To avoid mechanical damage, it is advised to transport the device in an impact-proof package. Before usage, the device should be placed so that its LED indicators are visible. They show the status of device operation.
- When connecting the 2x10 connector cables to the vehicle, the appropriate jumpers of the power supply of the vehicle should be disconnected.
- Before dismounting the device from the vehicle, the 2x10 connector must be disconnected.
- The device is designed to be mounted in a zone of limited access, which is inaccessible to the operator. All related devices must meet the requirements of EN 62368-1 standard.
- The device FMC640 is not designed as a navigational device for boats.

Do not disassemble the device. If the device is damaged, the power supply cables are not isolated or the isolation is damaged, DO NOT touch the device before unplugging the power supply.

All wireless data transferring devices produce interference that may affect other devices which are placed nearby.

The device must be connected only by qualified personnel.

The device must be firmly fastened in a predefined location.

The programming must be performed using a PC with autonomic power supply.

Installation and/or handling during a lightning storm is prohibited.

The device is susceptible to water and humidity.

# CERTIFICATION AND APPROVALS

This sign on the package means that it is necessary to read the User's Manual before your start using the device. Full User's Manual version can be found in our Wiki<sup>1</sup>.

The RoHS1 is a directive regulating the manufacture. import and distribution of Electronics and Electrical Equipment (EEE) within the EU, which bans from use 10 different hazardous materials (to date).

E-Mark and e-Mark are the European conformity marks issued by the transport sector, indicating that the products comply with relevant laws and regulations or directives. Vehicles and related products need to go through the E-Mark certification process to be legally sold in Europe.

This sign on the package means that all used electronic and electric equipment should not be mixed with general household waste.

The Declaration EAC and the Certificate EAC in conformity with the technical regulation TR CU of the EurAsEC Customs Union are EAC certification documents issued by independent organizations. Such organizations perform their function through laboratories accredited to the public agencies in charge of the supervision of metrology and standardization in the three countries of the EAC Custom Union, joining at the moment the certification system : Russia, Belarus, Kazakhstan, Armenia and Kyrgyzstan.

The Australian Standard AS/NZS 4417.1 and AS/NZS 4417.2 Marking of electrical products to indicate compliance with regulations - General rules for use of the mark provides general requirements for the use of the RCM including location of the marking on the equipment and its dimensional requirements.

SDPPI (Direktur Jenderal Sumber Daya dan Perangkat Pos dan informatika) is Indonesian Directorate General of Resources and Equipment for Post and Information Technology.

SIRIM QAS International Sdn. Bhd. is Malaysia's leading testing, inspection and certification body.

REACH addresses the production and use of chemical substances, and their potential impacts on both human health and the environment. Its 849 pages took seven years to pass, and it has been described as the most complex legislation in the Union's history and the most important in 20 years. It is the strictest law to date regulating chemical substances and will affect industries throughout the world.

#### DECLARATION OF IMEI ASSIGNMENT

The IMEI number is used by a GSM network to identify valid devices and therefore can be used for stopping a stolen phone from accessing that network. For example, if a mobile phone is stolen, the owner can call their network provider and instruct them to blacklist the phone using its IMEI number. This renders the phone useless on that network and sometimes other networks too, whether or not the phone's subscriber identity module (SIM) is changed.
