

# FMB965 System settings

[Main Page](#) > [Basic Trackers](#) > [FMB965](#) > [FMB965 Configuration](#) > **FMB965 System settings**

System settings have the following configurable parameters:

□

## Contents

- [1 System Settings](#)
  - [1.1 Movement Source](#)
  - [1.2 Speed Source](#)
  - [1.3 Records Saving/Sending Without TS](#)
  - [1.4 LED Indication](#)
  - [1.5 GNSS Source](#)
  - [1.6 Battery Charge Mode](#)
  - [1.7 Data Protocol](#)
- [2 Static Navigation Settings](#)
- [3 Sleep Mode](#)
- [4 Ignition Source](#)
- [5 Accelerometer Delay Settings](#)
- [6 Time Synchronization](#)
  - [6.1 Old Time Synchronization Settings\\*](#)
  - [6.2 New Time Synchronization method implementation](#)
- [7 Accelerometer Auto Calibration](#)
- [8 Low Power Mode](#)
- [9 Power off sleep mode](#)

## System Settings

### Movement Source

---

Movement source will be used to determine when a vehicle is on stop or moving.  
Possible movement sources:

- **Ignition** - if ignition (based on ignition source) is ON, Vehicle MOVING mode is used; if the ignition is OFF, Vehicle on STOP mode is used;
- **Accelerometer** (movement) - if accelerometer detects movement, Vehicle MOVING mode is

- used; if there is no movement detected, Vehicle on STOP mode is used;
- **GNSS** - if GPS fix is acquired and speed  $\geq 5$  km/h vehicle MOVING mode is used; if GPS speed  $< 5$  km/h, Vehicle on STOP mode is used;
  - **CAN speed** - If speed from BT OBDII dongle is higher than 0 km/h, Vehicle MOVING mode is used; If speed from BT OBDII dongle is equal 0 km/h, Vehicle on STOP mode is used;

If there is no GNSS fix, the accelerometer determines profile change. If there is no OBDII dongle active (or speed reported by dongle  $= 0$  km/h) accelerometer determines profile change.

**Note:** From new firmware version **03.25.14.Rev.03** added new **multiple movement sources selection** at once. If any of selected movement sources are active, movement mode will be activated. If all selected sources are inactive STOP mode will be enabled. Configurable movement parameter ID has been changed. Information regarding configurable parameter ID could be found in the table below:

Firmware version until <b>03.25.14.rev.03</b>	Firmware version from <b>03.25.14.rev.03</b>
100 - Parameter ID	138 - Parameter ID

## Speed Source

Speed source will be used to determine which speed source to use.

**Note:** If the speed source is configured as OBD / CAN, the device will try to take speed from OBD first. If the speed value read is 0, then it tries to take speed from CAN. If the speed value is also 0, the firmware takes the speed from GNSS, even though it is not configured.

## Records Saving/Sending Without TS

This feature will be used to save and send records to server without time synchronization.

Possible options:

- **After Position Fix** - records will be saved and send only after position fix;
- **After Time Sync** - records will be saved and send only after time synchronization;
- **Always** - records will be always saved and send even if will not be time synchronization.

**Note:** If record is without valid coordinates - (there were no GPS fix in the moment of data acquisition) - Longitude, Latitude and Altitude values are last valid fix, and Angle, Satellites and Speed are 0. After a reboot, it will send zero coordinates.

## LED Indication

---

### LED Indication

This feature will be used to indicate device status and navigate them.

**Note:** If this feature is enabled, you can check LEDs behavior [here](#).

## GNSS Source

---

In *GNSS Source* settings user can configure which GNSS system(s) to use.

### GNSS Source

**List of configurable GNSS sources:**

## Battery Charge Mode

---

In *Battery Charge Mode* settings user can choose when battery will be charged.

### Battery Charge Mode

Possible options:

- **On Need** - enable battery charger any time when needed;
- **After Ignition ON** - charger can be enabled after ignition is turned on, except if battery is fully charged or 10 minute timeout has not passed since device was turned on for faster FIX receiving;
- **Always** - enables charging all the time (even if any sleep mode is active).

## Data Protocol

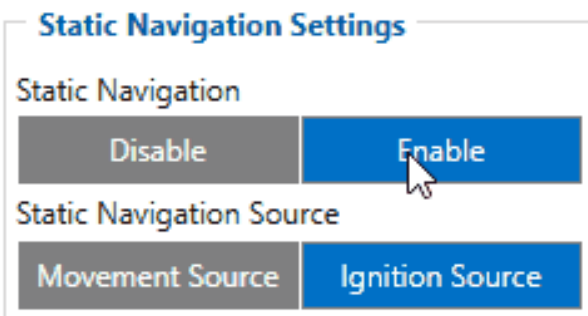

---

### Data Protocol

In *Data Protocol* settings user can choose which protocol version ([Codec 8](#) or [Codec 8 Extended](#)) will use for data sending to the server.

## Static Navigation Settings

*Static Navigation Mode* is a filter, which filters out track jumps when the object is stationary.

If the Static navigation filter is disabled, it will apply no changes to GPS data. If the Static navigation filter is enabled, it will filter changes in GPS position if no movement (configured movement source) or ignition (configured ignition source) is detected (depends on what static navigation settings are selected: movement, ignition or both sources). It allows filtering GPS jumps when an object is parked (is not moving) and GPS position is still traced.

## Sleep Mode

Sleep Settings:

This feature will be used to save power consumption of external battery (power supply). It let the user choose one of four power saving modes which he would prefer: [GPS Sleep](#), [Deep Sleep](#), [Online Deep Sleep](#) and [Ultra Deep Sleep](#).

Timeout:

After timeout is reached and all conditions for sleep mode are met, the device goes to sleep mode.

**Note:** Detail description and conditions about every mode you can find [here](#).

Wake up sources:

Option added from firmware version **03.27.10.Rev.487**, allows to adjust default exit of sleep conditions. Some of the settings work only on specific sleep modes:

- Movement Source and Ignition Source don't have an affect on Ultra and Power off sleep modes;
- Accelerometer (instant movement) only affects Ultra and Power off sleep modes;
- DIN1 only affects Ultra and Power off sleep modes. DIN1 shows up as a wakeup source if device has DIN1. FMB965/FMB930 will wake up from Power off sleep if a signal is applied to DIN1 no matter how this option is configured;
- Power voltage doesn't affect FMB devices. FMB965/FMB930 will wake up from Power Off sleep from an applied external voltage no matter how this option is configured;
- For selected sleep mode only applicable „Wake up source“ options are available.

## Ignition Source

Ignition source will be used to determine ignition of vehicle.

**Ignition Source**

Ignition Settings

DIN 1	Accelerometer
Power Voltage	Engine RPM
DIN 3	

High Voltage (mV)

Low Voltage (mV)

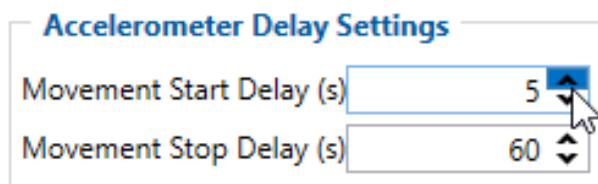

Possible ignition sources:

- **DIN 1** (Digital Input 1) - if *DIN1* is 1 - ignition is ON; if *DIN1* value is 0 - ignition is OFF;
- **Power Voltage** - if voltage is between High Voltage Level and Low Voltage Level (below *Ignition Settings* options) - ignition is ON; if voltage is higher than High Voltage Level or lower than Low Voltage Level - ignition is OFF.
- **Engine RPM** - if *RPM* from OBD II or CAN is higher than 0 - ignition is ON; if *RPM* from OBD II or CAN is equal to 0 - ignition is OFF;
- **Accelerometer** - if movement sensor detects movement - ignition is ON; if movement is not detected - ignition is OFF;

More than one ignition source can be selected at the same moment. When there are 2 or more sources selected, at least one condition has to be met to change Ignition status.

**Example:** DIN1 and Accelerometer are selected as the Ignition source. When the device detects movement, Ignition status will change to 1, regardless that DIN1 value is 0. Users can select movement start and movement stop delay time - those parameters are used when the accelerometer is selected as an ignition source. Ignition status is used in power management and the following functionalities: [Eco/Green Driving](#), [Excessive Idling](#), Fuel Consumption, [Over Speeding](#), [Towing Detection](#) and [Trip](#).

## Accelerometer Delay Settings

The screenshot shows a settings window titled "Accelerometer Delay Settings". It contains two input fields: "Movement Start Delay (s)" with a value of 5 and "Movement Stop Delay (s)" with a value of 60. A mouse cursor is pointing at the up arrow of the first spinner control.

*Accelerometer Delay Settings* will be used to set the timeout of delay when a detected accelerometer status change occurs.

**Note:** these settings impact ignition/movement sources.

The user can set:

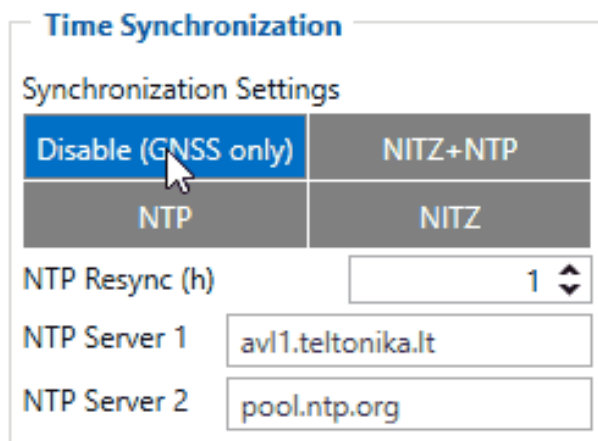

- **Movement Start Delay (s)** - movement start delay in seconds;
- **Movement Stop Delay (s)** - movement stop delay in seconds;

## Time Synchronization

*Time Synchronization settings* will be used to set how device time will be re-synchronized.

### Old Time Synchronization Settings\*

---

The screenshot shows a settings window titled "Time Synchronization". Under "Synchronization Settings", there is a 2x2 grid of buttons: "Disable (GNSS only)" (highlighted in blue), "NITZ+NTP", "NTP", and "NITZ". Below this grid are three input fields: "NTP Resync (h)" with a value of 1, "NTP Server 1" with the value "avl1.teltonika.lt", and "NTP Server 2" with the value "pool.ntp.org".

*Synchronization settings* is used for choosing the device's internal time synchronization source. Possible options are:

- **GPS Only** - time synchronization by GPS;
- **NITZ and NTP** - time synchronization from GSM operators (NITZ) and/or web server (NTP);
- **NTP** - time synchronization from NTP server only;
- **NITZ** - time synchronization from GSM operators (NITZ).

*NTP Resync* parameter determines how often a device should resynchronize its time. If the set value is not equal to zero, time resynchronization will occur periodically at time intervals to which this parameter is set.

*NTP server 1* and *NTP Server 2* let the user select which NTP server (s) will be used to resynchronize time.

\* using 03.25.13 or older firmware

## New Time Synchronization method implementation

---

From 03.25.14 firmware the new time synchronization works by waiting a minute on startup to acquire fix and consequently synchronizes the time via GNSS.

This state checks the difference between RTC and GNSS times every second. If the difference of at least 3 seconds persists to be for 5 seconds, the firmware triggers a re-synchronization procedure by GNSS.

After that, the time difference is still calculated, but the difference is expected to persist for at least 5 minutes to trigger a GNSS time re-synchronization.

In the case that there is no fix or it is lost during the syncing by GNSS state, the firmware goes to the state of syncing by NTP. Entering the state of NTP syncing, the firmware immediately attempts to synchronize the time by triggering NTP and later on, does this periodically every time the configured NTP re-synchronization time is reached (if the re-synchronization time is set to 0 - no NTP sync is performed at all). Time synchronization by NITZ can occur at any time.

## Accelerometer Auto Calibration

Users can disable or enable Accelerometer Auto Calibration and Gravity Filter features. This feature is available from firmware version 03.25.07.Rev.00. Under Accelerometer Auto Calibration settings, user can choose:

- **Disable** - do not use auto-calibration feature (sends AXES raw data).
- **Once** - calibrate one time only.
- **Continuous** - continuously analyzes current data and re-calibrates if needed.

**Important!** If Auto calibration is disabled, the device should be mounted according to the User manual for EcoDriving feature to work properly. If enabled, AXES will be reoriented to VEHICLE axes according to the User manual (+X - Forward, +Y - Left, +Z - Down).

Gravity filter subtracts gravity from vector when devices are calibrated or if auto-calibration is

disabled (default values). Gravity is only removed when gravity filter is enabled. Filter settings, user can choose:

- **Disabled** - do not remove GRAVITY component from AXL/Crash data.
- **Enabled** - remove GRAVITY component from AXL/Crash.

**Note:** In [FMB965](#) devices autocalibration is set by default and it is not configurable via configurator. Device connected to OBD port is not positioned according to the vehicle axis and in this case autocalibration is a must.

## Low Power Mode

**Low Power Mode Settings**

Low Power Mode

Disable	Enable
Min Period (sec)	3600
GPS Search Period (sec)	60
GPS Accuracy (HDOP PDOP VDOP)	1.3
GPS Satellites Quantity	0
Hold GPS Fix Timeout (sec)	0

Low Power mode functionality was implemented to firmware from FMB.03.28.02.Rev.00. This functionality only works on devices that supports battery. It can only be active if device sleep mode is configured as Deep Sleep or Online Sleep. In other cases, low power mode is not allowed.

- **Min Period** - is timer after which device has to wake up (exit Deep or Online sleep state)
- **GPS Search Period** - is period in which device tries to acquire GPS fix after waking up
- **GPS Accuracy** - is value of minimum requirements of HDOP/PDOP/VDOP to renew GPS data after fix was acquired.
- **GPS Satellites Quantity** - is value of minimum visible satellites available to device to renew GPS data after fix was acquired.
- **Hold GPS Fix Timeout** - is timer in which device tries to hold GPS fix for better GPS data accuracy.

As mentioned before, this functionality only works if Deep sleep or Online sleep is configured. Device will enter Low Power mode if external power source is lost, but battery is connected. Device immediately will switch to it's configured sleeping mode without checking any conditions for sleeping mode. Only conditions for device to go to sleep are: is Low Power mode enabled, is external voltage missing, is there a battery connected.

**Note:** When device is in Low Power mode, device will not generate any records except for one

periodic record after every **Min Period**.

## **Power off sleep mode**

It allows to power off module to reduce power consumption to less than 1mA in a sleep mode. Power of sleep was added to FMB965 and FMB93X devices. This is the lowest possible power consumption mode. Device goes into power off state where module is powered off to save maximum amount of power and can only wake if there is movement by accelerometer, external power is applied, ignition (DIN1) is detected, or it is time to make the next periodic record.
