TCT WEB

Telematics Configuration WEB Tool (TCT WEB) is dedicated WEB software for managing Teltonika Telematics' new platform devices (FT). With just one application, you can configure multiple hardware models in a timely and efficient manner, whether you are a beginner or an experienced IoT professional.

TCT WEB allows the creation of offline device configurations and saves them to FOTA WEB. It supports only offline configuration without the possibility of connecting the device via USB cable or Bluetooth. It has advanced tooltips that enable users to configure devices without any external user manuals. It is possible to save the full configuration or only the changes made. The saved configuration is stored in FOTA WEB and is used only when a configuration update request is created on FOTA WEB.

Features Overview

While creating TCT WEB, we learned a lot of lessons from a long history of [Teltonika Configurator](), which helped us to significantly improve the user interface, optimize the settings structure, introduce search and filtering capabilities. Follow the links below to learn more.
