

Teltonika Configuration Tool Save Description

There are currently two options for saving the configuration:

The first option is **Full Save**, which is no different from the previous generation of the configurator. When this option is selected, the entire device configuration is written to a file or to the device.

Second option is **Save only changes** which is a newly introduced functionality. Let's break it down with an example. For this purpose let's choose FMB010, fill in fields APN, Domain, port and then click the button "Save to file". The first thing that catches your eye is "Show all changes". By clicking on this field, you can view what changes have been made to the configuration during the current session. Click on the list and see what has been changed. Now by clicking on the "Only changes" button, we will essentially only save the parameters specified in the list above.

It is worth mentioning that by default parameter 13003 (FOTA WEB Status) is also saved with value equal to 1. This is necessary in order for the device to be able to use FOTA Web.

The Configuration file saved with **Save only changes** option can be used to change certain settings on the devices. The configuration will only change the specified parameters (etc.: APN, Domain, IP), which makes it much easier to update the configuration.
