

FOTA WEB Groups

[Main Page](#) > [Software & Applications](#) > [FOTA WEB](#) > **FOTA WEB Groups**

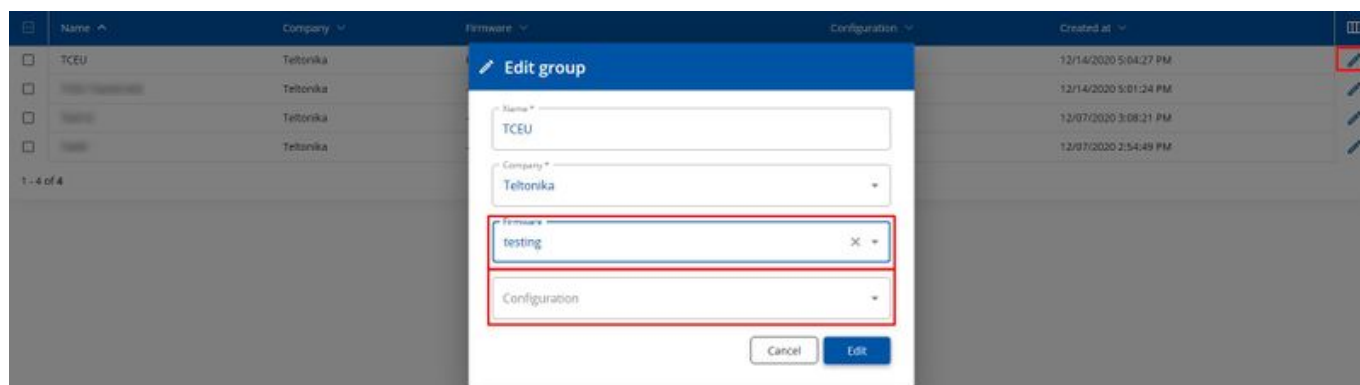

This chapter is an overview of the **GROUPS** menu.

Grouping allows you to manage devices based on their configuration (APN, SIM card, different data from FM), use scenario, firmware upgrade, etc.

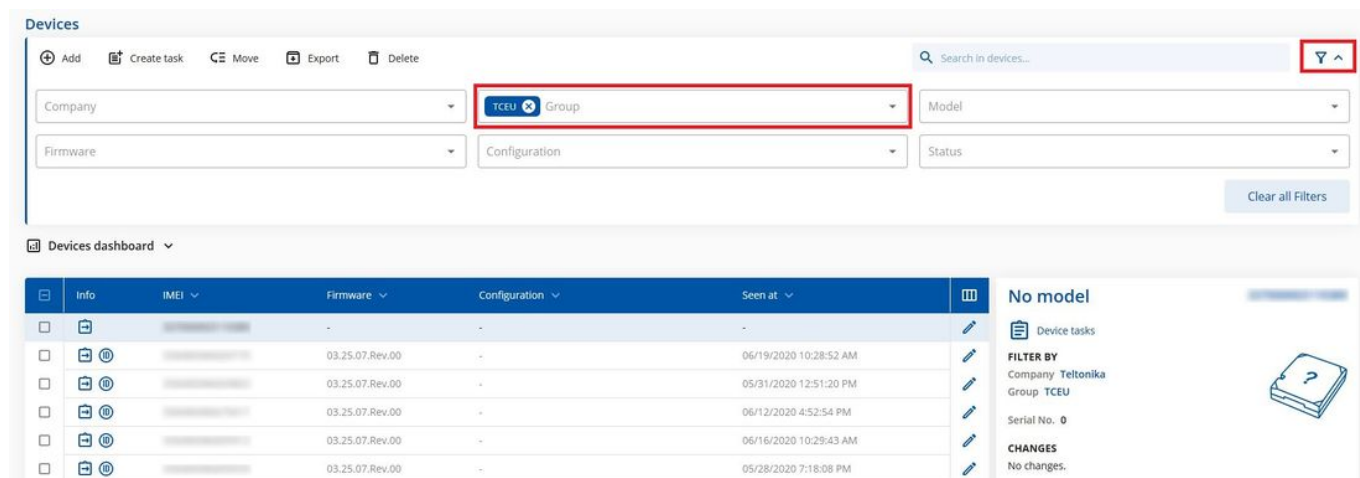

Actions

Under the **GROUPS** menu you can create new groups. Once a group is created you can add devices to that particular group. This can be done via the **DEVICES** menu. Please refer to [DEVICES -> Move](#) to group for explanation.

Once any number of devices have been assigned to a particular group, you can assign a task to the whole group via the **GROUPS** menu.

Or you can choose the group itself (in this case “demo”) in the **DEVICES** tab where you will automatically have all your devices filtered by your selected group.

NOTE: when the configuration or firmware file is assigned to the Group, the IMEIs which are inside the group will be always checking and updating to the assigned one.
